

Béla Iván (http://aki.ttk.mta.hu/polychem/English/Staff/CVs/IB_en.html) obtained his MS and PhD degrees at the Lorand Eotvos University, Budapest (Hungary). He is a Corresponding Member of the Hungarian Academy of Sciences. He has worked for the Institute of Materials and Environmental Chemistry of the Research Centre for Natural Sciences of the Hungarian Academy of Sciences in Budapest since 1975. Currently, he is the head of the Polymer Chemistry Research Group there, and adjunct professor of Eotvos University. As visiting scientist, he carried out research on cationic polymerization at the University of Akron for 6 years (1978-1980 and 1986-1990). He was a Humboldt Fellow at the University of Mainz and a guest professor at the Technical University of Denmark in the 1990s. His research interest includes polymerization mechanisms, degradation, stabilization and recycling of polymers, functional polymers, novel polymeric nanostructures and nanohybrids, polymeric nanomedicine and application possibilities thereof. He has more than 360 publications, 20 patents and a book coauthored with J. P. Kennedy, entitled „Designed Polymers by Carbocationic Macromolecular Engineering: Theory and Practice”.
